1 Overview

Two impact assessment methods are imported in the software OpenLCA version 1.6.3, that are ecoinvent v.3.3 LCIA methods and OpenLCA LCIA methods 1.5.6 v.3. In both methods CED methodology is considered with related impact categories. It is then possible to identify the impact factors (expressed in MJ, HHVs) that have to be calculated in MJ, LHV (Figure 1 and Figure 2).

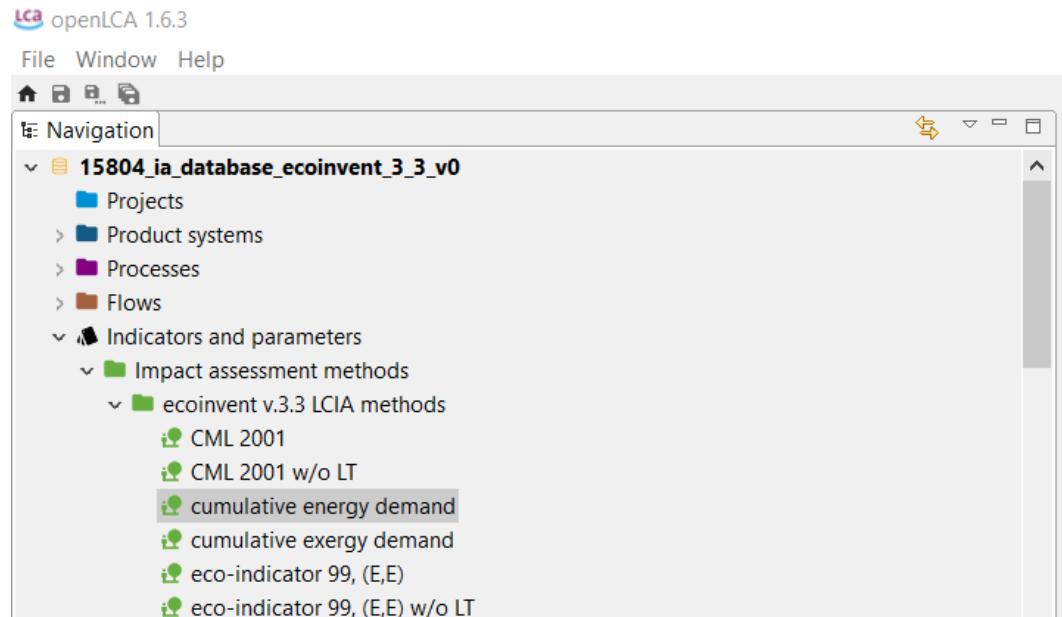

Figure 1: CED methodology, Ecoinvent methods

The screenshot shows the 'cumulative energy demand' impact assessment method page. The top navigation bar includes Console, Welcome, and cumulative energy demand. The main content area is titled 'Impact assessment method: cumulative energy demand'. A dropdown menu shows 'Impact factors'. Below is a table for the 'fossil - non-renewable energy resources, fossil' category:

Flow	Category	Flow property	Factor	Unit	Uncertainty
F Coal, brown, in ground	Resource/in ground	Mass	9.9	MJ-Eq/kg	none
F Coal, hard, unspecified, in gr...	Resource/in ground	Mass	19.1	MJ-Eq/kg	none
F Gas, mine, off-gas, process, ...	Resource/in ground	Volume	39.8	MJ-Eq/m ³	none
F Gas, natural, in ground	Resource/in ground	Volume	38.293	MJ-Eq/m ³	none
F Oil, crude, in ground	Resource/in ground	Mass	45.8	MJ-Eq/kg	none
F Peat, in ground	Resource/biotic	Mass	9.9	MJ-Eq/kg	none

Figure 2: Impact factors from impact category in CED methodology, Ecoinvent methods

2 Approach

2006 IPCC Guidelines for National Greenhouse Gas Inventories Volume 2, Energy define in chapter 1.4.1.2 Box 1.1 a recommended conversion between Gross (HHV) and Net (LHV) calorific values (Figure 3).

BOX 1.1
CONVERSION BETWEEN GROSS AND NET CALORIFIC VALUES

Units: MJ/kg - Megajoules per kilogram; 1 MJ/kg = 1 Gigajoule/tonne (GJ/tonne)

Gross CV (GCV) or 'higher heating value' (HHV) is the calorific value under laboratory conditions.

Net CV (NCV) or 'lower heating value' (LHV) is the useful calorific value in boiler plant. The difference is essentially the latent heat of the water vapour produced.

Conversions - Gross/Net (per ISO, for As Received* figures) in MJ/kg:

$$\text{Net CV} = \text{Gross CV} - 0.212H - 0.0245M - 0.008Y$$

where M is percent Moisture, H is percent Hydrogen, Y is percent Oxygen (from ultimate analysis which determines the amount of carbon, hydrogen, oxygen, nitrogen and sulphur) As Received (i.e. includes Total Moisture (TM)).

Source: World Coal Institute (<http://www.worldcoal.org/pages/content/index.asp?PageID=190>), which provides more details.

Figure 3: Conversion between HHVs and LHVs

As the calculation of percent Moisture, Hydrogen and Oxygen for all the impact factors previously identified is not straightforward, the calculation of LHV's refers to the following sources which show tables with default Net Calorific Values:

- a. World Coal Institute¹.
- b. 2006 IPCC Guidelines for National Greenhouse Gas Inventories Volume 2, Energy. Chapter 1.4.1.3 and Table 1.2.
- c. Hydrogen Tools, Pacific Northwest National Laboratory².
- d. IEA's Energy Statistics Manual (OECD/IEA 2005), Chapter 5.7 and Table A3.12³.
- e. ECN Phyllis 2. Database for biomass and waste. Energy Research Centre for the Netherlands⁴.
- f. Krajnc, N., Wood Fuels Handbook, Food and Agriculture Organization of the United Nations, Pristina 2015⁵. Table 10.
- g. Forest Products Laboratory, United States Forest Service⁶.

¹ http://www.drummondco.com/wpcontent/uploads/coalconversionfacts200704_06_2009.pdf

² <https://h2tools.org/hyarc/calculator-tools/lower-and-higher-heating-values-fuels>

³ <https://www.iea.org/publications/freepublications/publication/energy-statistics-manual.html>

⁴ <https://www.ecn.nl/phyllis2>

⁵ <http://www.fao.org/3/a-i4441e.pdf>

⁶ <https://www.fpl.fs.fed.us/documents/techline/fuel-value-calculator.pdf>

When the LHV_s are taken from Table 1.2 in 2006 IPCC Guidelines (source b) the Net Calorific Value in the first column is considered for this report, but lower and upper limits of the 95% confidence intervals must be taken into account too.

2.1 Clarification on coal

The definition of LHV_s for coal flows follows the coal classification suggested by IEA (International Energy Agency)⁷. The relationship between coal types is the following:

1. Hard coal, coal with HHV > 24 MJ/kg or with HHV < 24 MJ/kg and a Vitrinite mean Random Reflectance > 0.6 per cent.

- Anthracite: hard coal with HHV > 24 MJ/kg and a Vitrinite mean Random Reflectance > 2.0 per cent.

- Bituminous coal: coal with HHV > 24 MJ/kg and a Vitrinite mean Random Reflectance < 2.0 per cent or with HHV < 24 MJ/kg and a Vitrinite mean Random Reflectance > 0.6 per cent. Bituminous coal includes coking coal and other bituminous coal.

2. Brown coal, coal with HHV < 24 MJ/kg and a Vitrinite mean Random Reflectance < 0.6 per cent.

- Sub bituminous coal: brown coal with 20 MJ/kg < HHV < 24 MJ/kg.

- Lignite: brown coal with HHV < 20 MJ/kg.

This classification is used in the present report to identify the coal flows from their HHVs and find then corresponding LHV_s in the tables from the sources already mentioned.

Furthermore, according to *2006 IPCC Guidelines, Volume Energy*, Chapter 1.4.1.2 and *IEA's Energy Statistics Manual (OECD/IEA 2005)*, Chapter 5.7, if net calorific values for coals are not available they can be estimated by subtracting 5% to the gross value. When this approximation is used, the source reference is expressed with letter d.

2.2 Clarification on oil and natural gas

According to *2006 IPCC Guidelines, Volume Energy*, Chapter 1.4.1.2 and *IEA's Energy Statistics Manual (OECD/IEA 2005)*, Table A3.12., if net calorific values for oil and natural gas are not

⁷ http://www.iea.org/interenerstat_v2/meeting/2009/Coal.pdf

available, then they can be estimated by subtracting 5% and 10% to the gross value. Moreover, according to *IPCC Guidelines* the conversion LHV = 90% HHV can be used for manufactured gas when there is no further information available. When this approximation is used, the source reference is expressed with letter d.

2.3 Clarification on wood

The calculation of “softwood, INW, standing” considers the density of larch (500 kg/m³) as a reference tree type for the flow, while “softwood, US PNW, standing” considers Douglas fir (density, 530 kg/m³). The reference tree for the flow “softwood, US SE, standing” is a pine (density, 400 kg/m³).

As no information was provided to define standing unspecified wood flow, the values for spruce were assumed in Phyllis 2 database.

2.4 Clarification on biomass.

When no specific information is provided for biomass energy, the values for wood waste from Phyllis 2 database are assumed. In the case of biomass-primary forest the heating values referred to spruce tree are considered.

2.5 HHVs and LHVs table organization

Table 2 is organized in 8 columns: indication of CED methodology (Ecoinvent or OpenLCA), reference ID for the flow, flow name, impact category name, units, HHVs and LHVs values, LHV source.

Table 1 summarizes the sources used for LHV calculation as they are reported with a letter in the last column of Table 2. If the flow name in the source shows some differences in comparison with the name of the impact factor, a clarification is added representing the name of the flow selected in the sources.

Table 1: Sources for LHV calculation

Letter	Source
a	World Coal Institute
b	IPCC Guidelines

c	Hydrogen Tools
d	IEA's energy statistics manual
e	Phyllis 2
f	Wood Fuels Handbook
g	Forest Products Laboratory

3 Impact factors in MJ, HHVs and LHVs

Table 2: Impact factors, CED methodology in Ecoinvent v.3.3 and OpenLCA 1.5.6 v.3 methods, HHVs and LHVs (M = moisture content)

CED Methodology	REF_ID	FLOW_NAME	IMPACTCATEGORY_NAME	UNITS	HHVs	LHVs	LHV Source
